ATTORNEY FOR APPLICANT

Proposed amended claim

1. (Currently amended) A method, in a data processing system, for optimizing runtime execution of a computer program, comprising:

~~modifying~~ obtaining performance profile data accumulated during a trace of a computer program execution to include annotations based on the occurrence of one or more events during execution of the computer program, wherein the one or more events occur based on hardware counter values and performance indicators associated with one or more portions of the computer program;

obtaining code for the computer program;

~~providing the annotated performance profile data to a computer program compiler; and~~

~~identifying~~ determining a manner for compiling the code to provide one or more identified optimizations to the runtime execution of the computer program that may be performed based on the performance profile data and the annotations, wherein the one or more optimizations include at least one of an optimization to the instruction paths of the computer program at branch points such that a more contiguous execution of instructions within the computer program is achieved, and an optimization to storage of instructions or data in a cache so that portions of a cache line that is falsely shared are stored in the cache on different cache lines;

presenting the one or more identified optimizations to a programmer using one or more graphical user interfaces;

receiving one or more selected optimizations of the one or more identified optimizations selected by the programmer; and

compiling the code using the one or more selected optimizations to generate an optimized computer program.
